### **Diamond Drilling Program Underway at the Galeana Project, Mexico**

Almaden has been informed by its joint venture partner Grid Capital Corp (Grid) that Grid has commenced a diamond drill program on the Galeana gold-silver property in Chihuahua State, Mexico. Under terms of the joint venture with Almaden, Grid can earn a 60% interest in the Galeana property by spending US\$2,000,000 and issuing 400,000 shares to Almaden.

Grid has informed Almaden that the drill program will consist of a total of 1,500 meters to test two of the vein systems identified on the property, the Miguel Ahumada and Faldo Norte zones. The Galeana property hosts three major classic epithermal banded quartz-adularia vein systems, the San Miguel-Ahumada-Estrella de Oro, the Faldo Norte and the San Geronimo. All have had limited historic production prior to the Mexican revolution when all mining activity ceased. Mapping, sampling and alteration mineralogic and petrographic analyses of the veins in the Galeana area has resulted in the interpretation that the exposed veins represent a high level within the original hydrothermal system. This interpretation coupled with the identification of high gold grades in fragments found in breccia bodies identified on the property, suggest that the potential to identify high grade gold and silver ore shoots in the veins may increase with depth.

Exploration carried out on the Galeana property by Grid is under the direction of H. Leo King, P.Geo., a qualified person within the meaning of National Instrument 43-101. Samples will be sent to ALS Chemex Labs in North Vancouver for analysis.

Almaden currently has ten active joint ventures covering 12 properties, including seven properties in which partners are spending to earn an interest in the project and a regional exploration program with partner BHP Billiton underway to explore for copper-gold deposits in Mexico.

**Guadalupe Gold Silver Property optioned to Grid Capital**

Almaden Minerals Ltd. (Almaden) is pleased to announce that its 100% owned Guadalupe gold/silver project in Mexico has been optioned to Grid Capital Corp. (Grid). Under the terms of the agreement, Grid must issue to

Almaden 400,000 shares and complete exploration expenditures of US\$1,000,000 by June 30, 2007, to earn a 50% interest in the project. Grid is committed to issue 100,000 shares to Almaden upon TSX Venture Exchange approval of the agreement and to complete US\$50,000 in exploration expenditures by June 30, 2004. Grid may earn an additional 10% interest in the property by issuing a further 100,000 shares and spending a further US\$1,000,000 in exploration expenditures by December 31, 2008.

The Guadalupe project surrounds the town and mining camp of Guadalupe y Calvo in Chihuahua State, Mexico. Gold was discovered at Guadalupe y Calvo in October 1835. Production was sufficiently large that the Mexican Government built a mint at Guadalupe y Calvo in 1844. L.J. Buchanan (1981) estimated historic production at 2,000,000 ounces gold and 28,000,000 ounces silver. Estimated production grade was 37 g/t gold and 870 g/t silver.

Almaden and Grid view the Guadalupe project as an exceptional high-grade gold/silver target and the combined talents of Grid and Almaden will be focused on exploring this property. Grid has informed Almaden that it plans to carry out an exploration project on this new property in the next two months.

Almaden currently has ten active joint ventures covering 12 properties, including seven properties in which partners are spending to earn an interest in the project and a regional exploration program with partner BHP Billiton underway to explore for copper-gold deposits in Mexico.

**Fuego Project Optioned to Horseshoe Gold Mining Inc.**

Almaden is pleased to announce that it has signed an agreement with Horseshoe Gold Mining Inc. (Horseshoe) whereby Horseshoe would have the option to earn a 60% interest in the Almaden's wholly owned Fuego gold silver project in Mexico. The terms of the agreement, which are subject to regulatory approval, require Horseshoe to spend US\$2 Million exploring the Fuego project and issuing 1,000,000 shares of Horseshoe to Almaden in order to earn a 50% interest in the property. This would include a firm commitment to spend US\$200,000 by June 30, 2004 and issuing 200,000 shares of Horseshoe upon regulatory approval. Horseshoe has the option to acquire a further 10% interest in the property, for a total of 60%, by spending an additional US\$1 Million on exploration. Upon earning a 60% interest in the property, Horseshoe would have 120 days to acquire Almaden's remaining 40% interest in the property in return for a 40% interest in the issued capital of Horseshoe, to be issued by Horseshoe to Almaden at that time.

The Fuego property is a high-level, classic quartz-adularia epithermal vein system. The textures identified, including fine grained silica and electrum banding and bladed calcite, are typical of that associated with bonanza grade epithermal vein systems worldwide. Some very limited surficial historic workings exist on one of several banded veins identified within a more than 20 meter wide zone of veining and silicification in volcanic rocks. Banded quartz-adularia veins within the vein system generally dip shallowly and are up to at least 5 meters wide. In the initial work the parallel vein system has been traced nearly a kilometre along strike. To date 16 grab and chip rock samples have been taken on the property by Almaden, of both banded quartz adularia vein material and silicified volcanic wall rock. Of these samples of banded quartz vein material averaged 7.7 grams per tonne (g/t) gold and 300 g/t Ag, with a high of 29.9 g/t gold and 764 g/t Ag. Samples from silicified volcanic rock within the zone of veining averaged 1 g/t gold and 162 g/t Ag, with a high of 2.4 g/t gold and 953 g/t Ag. Visible gold was recognised in several hand specimens collected on the property which were not sent for analysis. Mr. H.L. King, M.A., P.Geo., the independent qualified person on the project under the meaning of National Instrument 43-101, reviewed this sampling during a recent site visit. Seven one meter chip samples and one grab sample were taken by Mr. King of quartz-adularia veining and silicified wallrock. Analyses of these samples ranged from 0.14 g/t Au and 26 g/t Ag to 10 g/t Au and 381

g/t Ag, and averaged 4.6 g/t Au and 123 g/t Ag. This sampling included 3 continuous 1 meter samples taken roughly across the dip of the accessible portion of an exposed vein, and averaged 7.8 g/t Au and 191 g/t Ag over the 3 meters.

The Fuego property has excellent infrastructure and represents an entirely unexplored epithermal vein system. Geologic mapping, geochemical rock and soil sampling and geophysical surveys are planned to define the extent of the vein system and the distribution of gold and silver. Fluid inclusion analyses were carried on several samples collected from exposed veins and confirmed the field interpretation that the veins are shallowly eroded.

Analyses were carried out by ALS Chemex Laboratories of Vancouver.

Almaden currently has eleven active joint ventures covering 12 properties, including nine properties in which partners are spending to earn an interest in the project and a regional exploration program with partner BHP Billiton underway to explore for copper-gold deposits in Mexico.
